Report #: 2304-1381

TITLE

Review the Permanent Installation of the Traffic Calming Pilot Project in the Crescent Park Neighborhood and Recommend to the City Council for Approval.

RECOMMENDATION

Staff recommends that the Planning and Transportation Commission (PTC) reviews and recommends to the City Council for approval of the permanent installation of the traffic calming pilot project in the Crescent Park Neighborhood.

EXECUTIVE SUMMARY

In 2018 residents of the Crescent Park area neighborhood raised traffic concerns regarding cut-through traffic, congestion, and speeding in their neighborhood. In response to these community concerns, the Office of Transportation staff initiated the Crescent Park Traffic Calming Project study to evaluate the project area. A pilot project with temporary improvements was developed by Consultants, Fehr and Peers, and City staff. With the approval of the Planning and Transportation Commission (PTC) and City Council in 2020, temporary improvements were installed in the summer of 2021. The temporary installation as a pilot program allowed staff to observe the traffic pattern and the potential changes.

In 2022, the pre-pilot and post-pilot data were analyzed to find the effectiveness of the traffic calming treatment. The analysis performed by City's consultant shows a reduction in speed as well as cut-through traffic in most segments. Staff also conducted the neighborhood survey to seek feedback from the residents. The majority of the residents voted in favor of making the treatments permanent. Therefore, staff recommends that PTC review and recommend City Council approval of the traffic calming project in the Crescent Park Neighborhood for permanent installation.

BACKGROUND

In January 2018, residents of the Crescent Park area neighborhood raised traffic concerns to the Office of Transportation staff. The residents cited ongoing cut-through traffic, congestion during

the peak hours and speeding in the off-peak hours as recurring issues in this neighborhood. In response to these community concerns, Office of Transportation staff initiated the Crescent Park Traffic Calming Project to study the project area and evaluated the neighborhood for potential traffic calming elements to be placed. Staff retained the services of Fehr & Peers Engineers (Consultant) to assist with the project study and traffic calming evaluation for the neighborhood.

Following the request, comprehensive traffic speed and volume data were collected in the neighborhood. Staff in coordination with the City's consultant developed initial concepts to implement traffic calming measures. Based on the comments received from the residents through neighborhood outreach and community meetings, the concepts were further refined. The final improvements included in the pilot project were: 1) curb extension improvements with three-way stop signs at Southwood Avenue & East Crescent Drive and 2) an oval-shaped traffic circle at the intersection of Hamilton Avenue, Center Drive & Southwood Drive, and 3) a 50 foot of protected bikeway on University Avenue eastbound direction at West Crescent Avenue.

The PTC conducted a hearing on the project on September 9, 2020 (Staff Report ID 11517)¹. At this meeting, PTC recommended the approval and implementation of a pilot traffic calming project trial in Crescent Park Neighborhood, to the City Council. The project was then approved by the City Council to proceed with the design and installation of temporary improvements on November 9, 2020 (Staff Report 11603)². The recommendation also included that staff would return to the City Council one-year after the implementation of the pilot program for direction on whether to make the improvements permanent or modify the alternatives.

The project elements were implemented in the summer of 2021. A year after the installation, traffic data was collected to review the effectiveness of the temporary traffic calming measures at these locations. The protected bikeway improvements on University Avenue are consistent with standard installation at other locations in the City and provide bicycle markings in accordance with the California Manual of Traffic Control Devices. Therefore, staff believes that such bike lane improvements should be continued as a permanent installation irrespective of the traffic calming project.

DISCUSSION

The comparison of the pre-pilot and post-pilot data was analyzed with a focus on travel speeds and traffic volume at key locations. The post-pilot analysis showed the volume on all street segments was reduced and the speeds also reduced on most street segments. The detailed data showing changes to the volumes and speeds of various street segments are depicted in Figures 2 and 3 of Attachment A. The data indicates that the temporary traffic calming measures have been effective in addressing the volume of cut-thru traffic as well as the speeding concerns in the

neighborhood. Staff, however, also believes that some of the traffic volume reduction is likely attributed due to the impact of the COVID pandemic and remote work, on traffic circulation. Attachment A to this report provides the Crescent Park Neighborhood Traffic Calming Post Pilot Memorandum compiling study analysis and results.

Following the review of field conditions, staff conducted a neighborhood survey in early 2023 to seek feedback and gain community input before proceeding with permanent improvements. The survey requested feedback from the neighborhood on the specific improvements at the two locations. The majority were in favor of converting the temporary improvements to permanent improvements at these locations. The results from the survey are as follows:

Project Location 1: Southwood Drive & East Crescent Drive: Curb Extensions and Stop Signs

- 74% of the neighborhood household voted YES to permanently install these calming measures
- 26% of the neighborhood household voted NO to permanently install these calming measures

Few residents in the immediate vicinity of this intersection raised concerns about the temporary improvements. Therefore, staff conducted an additional review of the survey results in the immediate geographic vicinity of Project Location 1 to determine the neighborhood response. This focused review also yielded 75% favor to continue with permanent improvements results at this location.

Project Location 2: Hamilton Avenue, Southwood Drive, and Center Drive: Oval-Shaped Traffic Circle

- 78% of the neighborhood households voted YES to a permanent installation of the oval-shaped traffic circle
- 22% of the neighborhood households voted NO to a permanent installation of the oval-shaped traffic circle

Based on the post pilot study and neighborhood feedback, staff supports these improvements to be implemented on permanent basis. Therefore, staff recommends that PTC recommends City Council approve the permanent installation of the traffic calming pilot project in the Crescent Park Neighborhood.

NEXT STEPS

Following PTC approval, the Office of Transportation will seek City Council approval to permanently install these traffic calming measures. Upon the Council's approval, staff will initiate the design for permanent improvements. During the design process, staff will outreach the community and seek feedback in planning and designing the permanent improvements consistent with planning and engineering standards. In the meantime, the temporary improvements will remain in place.

RESOURCE IMPACT

The project will be funded from the existing Transportation and Parking Improvement Capital Improvement Project (PL-12000) that supports the neighborhood traffic calming projects. After the Planning and Transportation Commission recommendation as well as City Council approval, the design of the permanent construction will begin.

ENVIRONMENTAL

REVIEW

The proposed modifications are minor upgrades to an existing residential street right-of-way and would not result in any new impacts on the existing environment. This project is considered as a minor alteration to the existing street system, and therefore categorically exempt (Class 1 Exemption, Section 15301) from the provisions of the California Environmental Quality Act (CEQA).

Subject: Crescent Park Neighborhood Traffic Calming Post-Pilot Memorandum

SJ21-2081.07

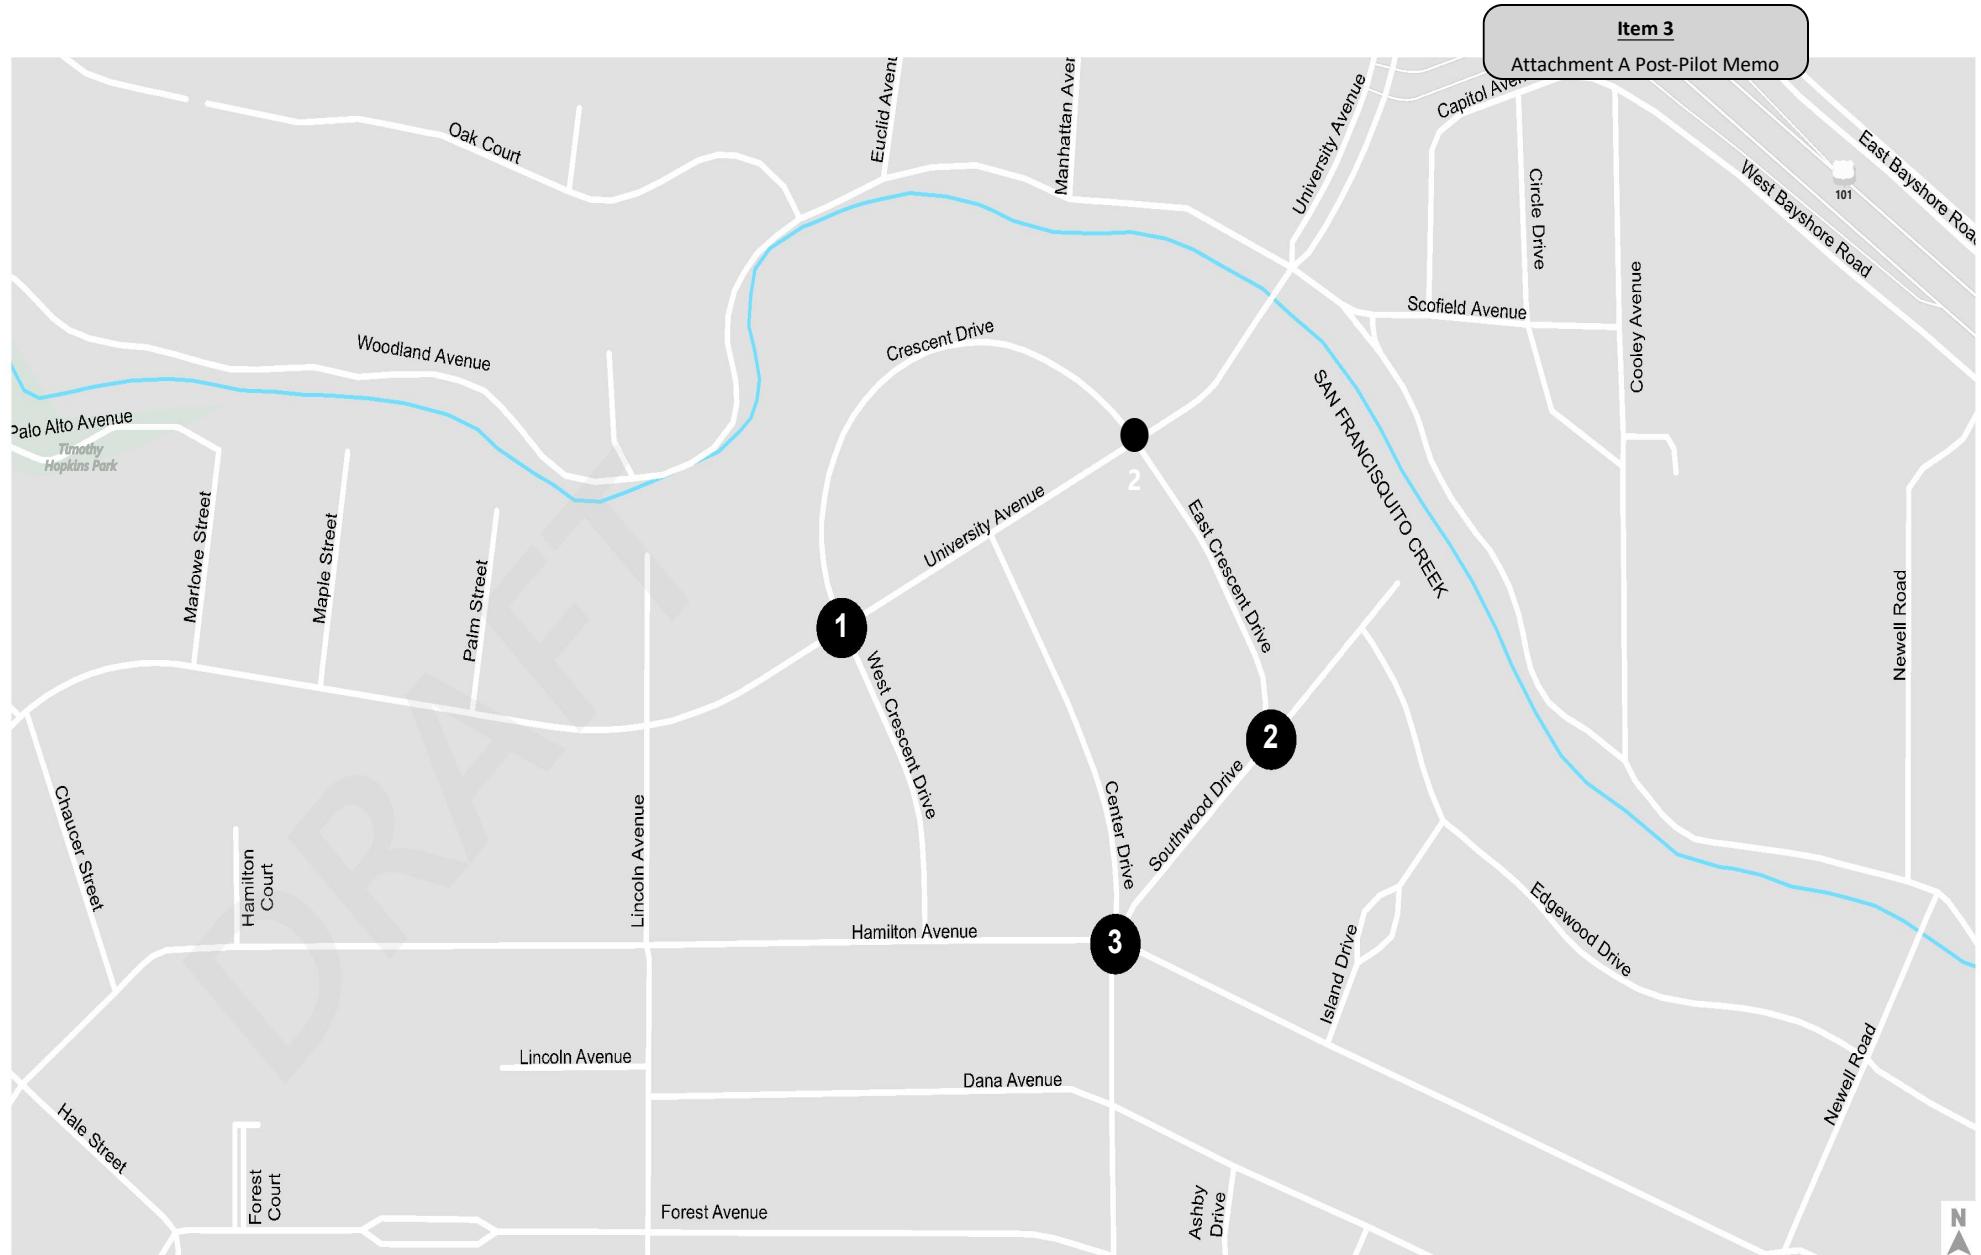

The Crescent Park Traffic Calming Pilot Study is an effort by the City of Palo Alto to investigate the implementation of traffic calming measures to reduce cut-through traffic and vehicular speeding in the Crescent Park neighborhood. Crescent Park is a residential neighborhood adjacent to Palo Alto's northern boundary.

A pre-Pilot memorandum summarizes the pre-existing traffic conditions, goals of the Pilot, development of traffic calming measures to evaluate effective treatments, and proposed implementation and monitoring. The post-Pilot memorandum describes the proposed treatments considering Pilot goals. This post-Pilot memorandum details the traffic calming treatments implemented in August 2021, evaluates the effectiveness of traffic data collected in 2022 and a discussion of Covid-19 trends, and presents next steps for traffic calming in Crescent Park.

Study Area

The Crescent Park neighborhood is generally bound by San Francisquito Creek to the north, Newell Road to the east, Channing Avenue to the south, and Middlefield Road to the west. Crescent Park is a residential neighborhood that spans the area between the City's commercial core, Downtown Palo Alto, to the west, and the US 101 corridor, providing vehicular access to much of the Bay Area, to the east. University Avenue, which serves as an arterial connection between Downtown Palo Alto and US 101, passes through the neighborhood. After the initial analysis and community outreach in 2019 and 2020, City Council selected the following intersections to implement traffic calming pilot implementation as shown in **Figure 1**:

1. University/West Crescent Drive
2. East Crescent Drive/Southwood Drive
3. Center Drive/Southwood Drive/Hamilton Avenue

Intersection Pilot Elements

In August 2021, the City implemented Pilot intersection traffic calming treatments in the three study locations listed above. Pilot intersection treatment design elements are described and shown below. Full design drawings are provided in **Appendix A**.

1. **University Avenue/West Crescent Drive:** The Pilot installed flexible bollards and striping along eastbound bicycle lane to provide bicycle lane protection and discourage right-turning drivers from using the bicycle lane as a vehicular travel lane from which to merge into eastbound University Avenue traffic.
2. **East Crescent Drive/Southwood Drive:** The Pilot re-gained East Crescent Drive into a 90-degree T-intersection using rubber curb. This included implementing all-way stop control to better manage movements through the intersection.

3. **Center Road Drive/Hamilton Avenue:** The Pilot maintained existing roadway alignment, providing an oval-shaped traffic circle in the center of the Hamilton Avenue / Center Road intersection. The treatment also added a double-yellow centerline to separate traffic approaching the intersection on all roadways. The five-way stop control approaching the intersection was maintained per the existing configuration.

Data Collection

To better understand pre- and post-Pilot traffic and circulation patterns, three types of traffic counts were collected throughout the study area before and after the Pilot in May 2019 and October 2022:

- 24-hour average and 85th-percentile speed counts, shown in **Table 1**
- Peak hour vehicle volume counts, shown in **Table 2**
- 24-hour vehicular volume counts, shown in **Table 3**.

Community engagement and pre-pilot observations indicated that cut-through traffic was most noticeable during weekday afternoons when higher eastbound volumes and longer queues on University Avenue made Hamilton Avenue an attractive alternate route. As such, an evaluation of eastbound PM peak traffic was also conducted shown in **Table 4**.

Percentage changes in vehicle speeds are presented in **Figure 2: Percent Change in Vehicle Speeds, 2019-2022** and percentage changes in vehicle volumes are shown in **Figure 3**. Raw data collection sheets are included in **Appendix A**.

Discussion

Traffic Volume

While vehicle volumes have returned to some degree since the beginning of the Covid-19 pandemic, traffic patterns are still substantially altered since 2019. In particular, peak hour commute traffic has not returned to pre-pandemic volumes. In the study area, this is evident in the difference between pre- and post-Pilot counts for the neighborhood streets and on University Avenue.

To address the ongoing altered travel patterns, the comparison between pre- and post- pilot volumes are based on the hour with the highest volumes traveling eastbound on University Avenue, which would be the time period in which cut-through traffic is most likely to occur. As presented in **Table 4**, this peak hour in the pre-pilot scenario is 1:00-2:00 PM and in the post-pilot scenario is 2:00-3:00 PM. **Table 2** presents the worst case scenario for each segment in the pre- and post-pilot scenarios, on a segment-by-segment ba

During this eastbound early afternoon peak, volumes on University Avenue are slightly higher (2-4%) in the post-pilot scenario, and volumes on most of the studied neighborhood streets are lower. In total, the volumes show that overall demand in the area has decreased, allowing slightly higher through traffic on University Avenue with less congestion. University Avenue is generally accommodating and, alleviating the demand for drivers to seek alternate routes such as Hamilton Avenue and encouraging the use of Hamilton Avenue for the Pilot project installations may cause some deterrent decisions more than the overall reduction in traffic demand.

With the reduced rough traffic potentially combined with the positive effects of the traffic calming pilot, neighborhood streets are now very low, with bi-directional daily volumes generally less than 3,000 vehicles per day on Hamilton and Lincoln Avenues and even lower volumes on Center and Crescent Streets.

Traffic Speed

Despite these low volumes, 85th percentile speeds on neighborhood streets are still consistently near or above 25 mph, with some fluctuations but overall little change from pre-Pilot speeds. Speeds are highest on Hamilton Avenue where 85th percentile speeds are above 30mph between Lincoln Avenue and Chaucer Court. Locations with higher speeds are further from the project locations and are generally along longer blocks.

Speed reductions in the vicinity of the Pilots are likely affected by the Pilot installations themselves. Some reductions in average speed were observed in other segments, but were likely unrelated to the specific Pilot implementations. In some cases, a reduction in cut-through traffic

may correlate with a reduction in travel speeds regardless of cause as cut-through traffic is sometimes associated with more aggressive driver behavior.

Conclusion

While the traffic data is generally inconclusive on the effect of the Pilot because of the changes in traffic demand due to Covid-19, the traffic calming installations are still valuable in slowing turning speeds, organizing vehicle movements at complex intersections, and improving overall intersection safety. While sufficient safety data is not available to assess the effects of the project quantitatively, future community outreach should seek to determine whether neighbors are observing the desired effects and experiencing improved driver behavior at the study intersections.

The Pilot included modifications at three intersections, with some of the modifications specifically focused on drivers making certain movements (i.e., the separate bikeway at University Avenue/W. Crescent Drive deterring undesirable behavior by drivers making northbound right-turn movements). Because of this focus, a more widespread effect on travel speeds and traffic calming throughout the neighborhood was not expected to be observed as part of the Pilot.

In general, no negative outcomes from the Pilot installations were identified, and incorporation of permanent intersection improvements that reduce intersection size, reduce turning speeds, and clarify right-of-way between vehicles is likely to be beneficial. Additional mid-block and/or intersection traffic calming should be considered to further reduce speeding, even when traffic volumes are low. Timing traffic treatments are most effective when they are implemented with enough frequency to influence drivers more broadly, including providing greater deterrence.
